背景: This gene is one of several cytokine genes clustered on the q-arm of chromosome 17. Cytokines are a family of secreted proteins involved in immunoregulatory and inflammatory processes. The CC cytokines are proteins characterized by two adjacent cysteines. The cytokine encoded by this gene displays chemotactic activity for lymphocytes and monocytes but not for neutrophils. This cytokine also shows a potent myelosuppressive activity and suppresses proliferation of myeloid progenitor cells. The expression of this gene is upregulated by IL-10.

Product Description

Pioneering GTPase and Oncogene Product Development since 2010

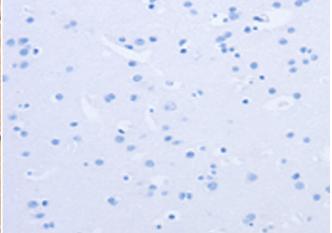

Immunohistochemistry analysis of paraffin embedded Human Lymphoma tissue using 220428(CCL16 Antibody) at a dilution of 1/50(Cytoplasm).

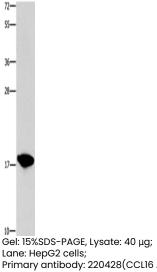

In comparision with the IHC on the left, the same paraffin-embedded Human Lymphoma tissue is first treated with the synthetic peptide and then with 220428(Anti-CCL16 Antibody) at dilution 1/50.

The image on the left is immunohistochemistry of paraffinembedded Human brain tissue using 220428(Anti-CCL16 Antibody) at a dilution of 1/50.

In comparision with the IHC on the left, the same paraffin-embedded Human brain tissue is first treated with synthetic peptide and then with D261517(Anti-CCL16 Antibody) at dilution 1/50.
