背景: Three different forms of human pancreatic procarboxypeptidase A have been isolated. The encoded protein represents the A2 form, which is a monomeric protein with different biochemical properties from the A1 and A3 forms. The A2 form of pancreatic procarboxypeptidase acts on aromatic C-terminal residues and is a secreted protein.

Immunohistochemistry analysis of paraffin embedded Human tonsil tissue using 217301(CPA2 Antibody) at a dilution of 1/40(Cytoplasm).

In comparison with the IHC on the left, the same paraffin-embedded Human tonsil tissue is first treated with the fusion protein and then with 217301(Anti-CPA2 Antibody) at dilution 1/40.

The image on the left is immunohistochemistry of paraffin-embedded Human gastric cancer tissue using 217301(Anti-CPA2 Antibody) at a dilution of 1/40.

In comparison with the IHC on the left, the same paraffin-embedded Human gastric cancer tissue is first treated with fusion protein and then with D222139(Anti-CPA2 Antibody) at dilution 1/40.
