**UNIPROT ID:** Q9NRR4 (Gene Accession - NP\_037367)

**背景:** This gene encodes a ribonuclease (RNase) III double-stranded RNA-specific ribonuclease and subunit of the microprocessor protein complex, which catalyzes the initial processing step of microRNA (miRNA) synthesis. The encoded protein cleaves the stem loop structure from the primary microRNA (pri-miRNA) in the nucleus, yielding the precursor miRNA (pre-miRNA), which is then exported to the cytoplasm for further processing. In a human cell line lacking a functional copy of this gene, canonical miRNA synthesis is reduced. Somatic mutations in this gene have been observed in human patients with kidney cancer.

Immunohistochemistry analysis of paraffin embedded Human esophagus cancer tissue using 215687(DROSHA Antibody) at a dilution of 1/45(Nucleus).

In comparison with the IHC on the left, the same paraffin-embedded Human esophagus cancer tissue is first treated with the synthetic peptide and then with 215687(Anti-DROSHA Antibody) at dilution 1/45.
