背景: This gene encodes an epididymal protease inhibitor, which contains both kunitz-type and WAP-type four-disulfide core (WFDC) protease inhibitor consensus sequences. Most WFDC genes are localized to chromosome 20q12-q13 in two clusters: centromeric and telomeric. This gene is a member of the WFDC gene family and belongs to the telomeric cluster. The protein can inhibit human sperm motility, and polymorphisms in this gene are associated with male infertility. Read-through transcription also exists between this gene and the downstream WFDC6 (WAP four-disulfide core domain 6) gene.

Immunohistochemistry analysis of paraffin embedded Human gastric cancer tissue using 220527 (EPPIN Antibody) at a dilution of 1/25 (Cytoplasm).

In comparison with the IHC on the left, the same paraffin-embedded Human gastric cancer tissue is first treated with the synthetic peptide and then with 220527 (Anti-EPPIN Antibody) at dilution 1/25.

The image on the left is immunohistochemistry of paraffin-embedded Human liver cancer tissue using 220527 (Anti-EPPIN Antibody) at a dilution of 1/25.

In comparison with the IHC on the left, the same paraffin-embedded Human liver cancer tissue is first treated with synthetic peptide and then with D261654 (Anti-EPPIN Antibody) at dilution 1/25.
