背景: This gene encodes the alpha subunit of glucosidase II and a member of the glycosyl hydrolase 31 family of proteins. The heterodimeric enzyme glucosidase II plays a role in protein folding and quality control by cleaving glucose residues from immature glycoproteins in the endoplasmic reticulum. Expression of the encoded protein is elevated in lung tumor tissue and in response to UV irradiation. Mutations in this gene cause autosomal-dominant polycystic kidney and liver disease.

Immunohistochemistry analysis of paraffin embedded Human brain tissue using 221307(GANAB Antibody) at a dilution of 1/25(Cytoplasm).

In comparison with the IHC on the left, the same paraffin-embedded Human brain tissue is first treated with the synthetic peptide and then with 221307(Anti-GANAB Antibody) at dilution 1/25.

The image on the left is immunohistochemistry of paraffin-embedded Human prostate cancer tissue using 221307(Anti-GANAB Antibody) at a dilution of 1/25.

In comparison with the IHC on the left, the same paraffin-embedded Human prostate cancer tissue is first treated with synthetic peptide and then with D262838(Anti-GANAB Antibody) at dilution 1/25.
