背景: This gene belongs to the homeobox family of genes. The homeobox genes encode a highly conserved family of transcription factors that play an important role in morphogenesis in all multicellular organisms. Mammals possess four similar homeobox gene clusters, HOXA, HOXB, HOXC and HOXD, located on different chromosomes, consisting of 9 to 11 genes arranged in tandem. This gene is one of several homeobox HOXD genes located at 2q31-2q37 chromosome regions. Deletions that removed the entire HOXD gene cluster or 5' end of this cluster have been associated with severe limb and genital abnormalities.

Immunohistochemistry analysis of paraffin embedded Human lung cancer tissue using 215133(HOXD3 Antibody) at a dilution of 1/25(Nucleus).

In comparison with the IHC on the left, the same paraffin-embedded Human lung cancer tissue is first treated with the synthetic peptide and then with 215133(Anti-HOXD3 Antibody) at dilution 1/25.

The image on the left is immunohistochemistry of paraffin-embedded Human esophagus cancer tissue using 215133(Anti-HOXD3 Antibody) at a dilution of 1/25.

In comparison with the IHC on the left, the same paraffin-embedded Human esophagus cancer tissue is first treated with synthetic peptide and then with D162928(Anti-HOXD3 Antibody) at dilution 1/25.
