背景: Potassium channels are present in most mammalian cells, where they participate in a wide range of physiologic responses. The protein encoded by this gene is an integral membrane protein and inward-rectifier type potassium channel. The encoded protein, which has a greater tendency to allow potassium to flow into a cell rather than out of a cell, probably participates in establishing action potential waveform and excitability of neuronal and muscle tissues. Mutations in this gene have been associated with Andersen syndrome, which is characterized by periodic paralysis, cardiac arrhythmias, and dysmorphic features.

Immunohistochemistry analysis of paraffin embedded Human gastric cancer tissue using 222334(KCNJ2 Antibody) at a dilution of 1/50(Cytoplasm).

In comparison with the IHC on the left, the same paraffin-embedded Human gastric cancer tissue is first treated with the synthetic peptide and then with 222334(Anti-KCNJ2 Antibody) at dilution 1/50.

The image on the left is immunohistochemistry of paraffin-embedded Human thyroid cancer tissue using 222334(Anti-KCNJ2 Antibody) at a dilution of 1/50.

In comparison with the IHC on the left, the same paraffin-embedded Human thyroid cancer tissue is first treated with synthetic peptide and then with D264411(Anti-KCNJ2 Antibody) at dilution 1/50.
