背景: Neurofilaments are type IV intermediate filament heteropolymers composed of light, medium, and heavy chains. Neurofilaments comprise the axoskeleton and functionally maintain neuronal caliber. They may also play a role in intracellular transport to axons and dendrites. This gene encodes the medium neurofilament protein. This protein is commonly used as a biomarker of neuronal damage. Alternative splicing results in multiple transcript variants encoding distinct isoforms.

Immunohistochemistry analysis of paraffin embedded Human cervical cancer tissue using 220744(NEFM Antibody) at a dilution of 1/50(Cytoplasm).

In comparison with the IHC on the left, the same paraffin-embedded Human cervical cancer tissue is first treated with the synthetic peptide and then with 220744(Anti-NEFM Antibody) at dilution 1/50.

The image on the left is immunohistochemistry of paraffin-embedded Human liver cancer tissue using 220744(Anti-NEFM Antibody) at a dilution of 1/50.

In comparison with the IHC on the left, the same paraffin-embedded Human liver cancer tissue is first treated with synthetic peptide and then with D261950(Anti-NEFM Antibody) at dilution 1/50.
