背景: This gene encodes a member of the paraoxonase gene family, which includes three known members located adjacent to each other on the long arm of chromosome 7. The encoded protein is ubiquitously expressed in human tissues, membrane-bound, and may act as a cellular antioxidant, protecting cells from oxidative stress. Hydrolytic activity against acylhomoserine lactones, important bacterial quorum-sensing mediators, suggests the encoded protein may also play a role in defense responses to pathogenic bacteria. Mutations in this gene may be associated with vascular disease and a number of quantitative phenotypes related to diabetes. Alternatively spliced transcript variants encoding different isoforms have been described.

Immunohistochemistry analysis of paraffin embedded Human liver cancer tissue using 219592(PON2 Antibody) at a dilution of 1/80(Cytoplasm).

In comparison with the IHC on the left, the same paraffin-embedded Human liver cancer tissue is first treated with the fusion protein and then with 219592(Anti-PON2 Antibody) at dilution 1/80.

The image on the left is immunohistochemistry of paraffin-embedded Human breast cancer tissue using 219592(Anti-PON2 Antibody) at a dilution of 1/80.

In comparison with the IHC on the left, the same paraffin-embedded Human breast cancer tissue is first treated with fusion protein and then with D227873(Anti-PON2 Antibody) at dilution 1/80.
