背景: RNF148 (RING finger protein 148) is a 305 amino acid single-pass membrane protein that contains one PA (protease associated) domain and a single RING-type zinc finger. RNF148 is encoded by a gene that maps to human chromosome 7, which houses over 1,000 genes and comprises nearly 5% of the human genome. Chromosome 7 has been linked to Osteogenesis imperfecta, Pendred syndrome, Lissencephaly, Citrullinemia and Shwachman–Diamond syndrome. The deletion of a portion of the q arm of chromosome 7 is associated with Williams–Beuren syndrome, a condition characterized by mild mental retardation, an unusual comfirt and friendliness with strangers and an elfin appearance.

Immunohistochemistry analysis of paraffin embedded Human liver cancer tissue using 220859(RNF148 Antibody) at a dilution of 1/40(Cytoplasm).

In comparison with the IHC on the left, the same paraffin-embedded Human liver cancer tissue is first treated with the synthetic peptide and then with 220859(Anti-RNF148 Antibody) at dilution 1/40.

The image on the left is immunohistochemistry of paraffin-embedded Human brain tissue using 220859(Anti-RNF148 Antibody) at a dilution of 1/40.

In comparison with the IHC on the left, the same paraffin-embedded Human brain tissue is first treated with synthetic peptide and then with D262135(Anti-RNF148 Antibody) at dilution 1/40.
