背景: This gene encodes a member of the transcription elongation factor A (SII)-like (TCEAL) gene family. Members of this family may function as nuclear phosphoproteins that modulate transcription in a promoter context-dependent manner. The encoded protein is similar to transcription elongation factor A/transcription factor SII and contains a zinc finger-like motif as well as a sequence related to the transcription factor SII Pol II-binding region. It may exert its effects via protein-protein interactions with other transcriptional regulators rather than via direct binding of DNA. Multiple family members are located on the X chromosome. Alternative splicing results in multiple transcript variants encoding a single isoform.

Immunohistochemistry analysis of paraffin embedded Human tonsil tissue using 219585(TCEAL1 Antibody) at a dilution of 1/60(Nucleus).

In comparison with the IHC on the left, the same paraffin-embedded Human tonsil tissue is first treated with the fusion protein and then with 219585(Anti-TCEAL1 Antibody) at dilution 1/60.

The image on the left is immunohistochemistry of paraffin-embedded Human cervical cancer tissue using 219585(Anti-TCEAL1 Antibody) at a dilution of 1/60.

In comparison with the IHC on the left, the same paraffin-embedded Human cervical cancer tissue is first treated with fusion protein and then with D227851(Anti-TCEAL1 Antibody) at dilution 1/60.
