背景: USP32 (ubiquitin specific peptidase 32), also known as NY-REN-60, is a 1,604 amino acid protein that contains one DUSP domain and three EF-hand calcium binding domains. Localized to membranes in a lipid-anchored fashion and expressed in all normal tissues, USP32 catalyzes the conversion of a ubiquitin C-terminal thioester to a free ubiquitin and a thiol, a reaction that may influence several cellular processes.

Immunohistochemistry analysis of paraffin embedded Human liver cancer tissue using 218329(USP32 Antibody) at a dilution of 1/75(Cytoplasm).

In comparison with the IHC on the left, the same paraffin-embedded Human liver cancer tissue is first treated with the fusion protein and then with 218329(Anti-USP32 Antibody) at dilution 1/75.

The image on the left is immunohistochemistry of paraffin-embedded Human cervical cancer tissue using 218329(Anti-USP32 Antibody) at a dilution of 1/75.

In comparison with the IHC on the left, the same paraffin-embedded Human cervical cancer tissue is first treated with fusion protein and then with D224188(Anti-USP32 Antibody) at dilution 1/75.
