背景: The WNT gene family consists of structurally related genes which encode secreted signaling proteins. These proteins have been implicated in oncogenesis and in several developmental processes, including regulation of cell fate and patterning during embryogenesis. This gene is a member of the WNT gene family. It may be involved in breast cancer, and its protein signaling is likely a molecular switch that governs adipogenesis. This protein is 96% identical to the mouse Wnt10b protein at the amino acid level. This gene is clustered with another family member, WNT1, in the chromosome 12q13 region.

Immunohistochemistry analysis of paraffin embedded Human breast cancer tissue using 221143(WNT10B Antibody) at a dilution of 1/50(Cytoplasm).

In comparison with the IHC on the left, the same paraffin-embedded Human breast cancer tissue is first treated with the synthetic peptide and then with 221143(Anti-WNT10B Antibody) at dilution 1/50.

The image on the left is immunohistochemistry of paraffin-embedded Human tonsil tissue using 221143(Anti-WNT10B Antibody) at a dilution of 1/50.

In comparison with the IHC on the left, the same paraffin-embedded Human tonsil tissue is first treated with synthetic peptide and then with D262612(Anti-WNT10B Antibody) at dilution 1/50.
